Multiple Arrestee Segments Indicator

This information ensures that an arrestee is counted only once when a single apprehension results in clearing <u>more than one</u> Incident report for your jurisdiction. The arrestee data is duplicated in each of the previous Incident reports.

In such situations, C = Count is to be entered for the current arrestee and M = Multiple is to be entered in the previous Incident reports.

Example: After a suspect's apprehension for robbery, it was learned that he was also responsible for 5 previous robberies within your jurisdiction. Arrestee data should be entered for the current arrest with a C = Count. M = Multiple should be entered for the previous 5 robberies.

If the arrestee's apprehension does not cause your jurisdiction to submit Multiple Arrestee Segments for previously reported Incidents, then the entry should be N = Not Applicable.

Example: After a suspect's apprehension for robbery, it was determined that he was <u>not</u> involved in any other cases within your jurisdiction.

This information will allow for us to identify that one arrestee clears multiple incidents, but is only counted once.
